Brand Protection Operations Dashboard

Overview

This project focuses on building an operational analytics dashboard to monitor queue-level performance metrics, productivity behaviour, and accuracy trends. The dashboard provides a consolidated and structured analytical view of operational workflows that were previously tracked manually, improving overall visibility into performance.

Problem Context

Operational data was maintained across multiple queues using spreadsheets, which limited visibility into performance patterns and required significant manual effort for analysis. The absence of a centralized reporting interface made it difficult to evaluate productivity, track accuracy, and identify operational inefficiencies in a timely manner.
To address this, a Power BI dashboard was developed to centralize key operational indicators and enable streamlined monitoring and analysis.

Objectives

• Monitor processed volume trends
• Track productivity behaviour (APH)
• Evaluate accuracy stability
• Enable faster and more efficient operational review

Tools & Technologies

Power BI – Dashboard development & visualization
Microsoft Excel – Data preparation, cleaning, and structuring

Key Metrics Monitored

• Processed Volume
• APH (Average Productivity per Hour)
• Accuracy Performance

Dashboard Capabilities

• Daily and weekly volume tracking
• Productivity and accuracy trend analysis
• Queue-wise performance breakdown
• Interactive filtering for dynamic data exploration

Observations

- Processing volume showed variability across time periods, indicating fluctuating operational load
- Productivity behaviour aligned with workload distribution patterns across queues
- Accuracy remained consistently stable, reflecting controlled quality performance
- The dashboard significantly improved performance visibility and reduced manual analysis effort
